

ANAMET HIPROJACKET, HIPROTAPE & HIPROSILTAPE

The ultimate heatprotection for cables

Up to approximately +100°C most conduits offer good cable protection. Metal conduit itself withstands higher temperatures (up to +600°C), but have limited insulation properties. Proper heat protection and insulation can be provided by a high insulating outer jacket with protective cover, for example Hiprojacket and Hiprotape from Anamet Europe B.V.. Hiprojacket and Hiprotape offer high temperature protection and the outer cover offers excellent resistance to most industrial chemicals and hydraulic oils and are used in glass-, steel-, ceramics industry, steelworks, furnishing, machine- and apparatus-industry.

- Construction : Woven fibre glass, the method of production creates a hollow space between outside and inside cover.
- Cover specifications : Ironoxyde silicon rubber. Withstands melted metal and intense heat radiation.
- Special approvals : NFF 16-101: class I2, Oxygenindex LOI = 42,5 , flameretardant.
- Temperature : +260°C continous. Till +1090°C for approx. 20 minutes.
Till +1640°C for 15-30 seconds.
- Colour : Red

Hiprosiltape consists of specially compounded silicone rubber, which adheres only to itself. It is used to seal the ends of Hiprojacket and Hiprotape or cables to prevent oil or water from wicking into the glass fibre and destroying insulation values. It can also be used to repair or join sections of Hiprojacket, or to provide a moisture proof seal over irregular insulated shapes. Less expensive and more effective than clamps or liquid sealants.

HIPROJACKET (conduit)
